- ★ High res visuals have been provided as separate JPGS. We are looking for visual precision and elegant code.

- ★ The layout provided assumes a browser/device with a minimum width of 920px. At 920px and above, this layout is fixed, and should be vertically and horizontally centered within the screen.

- ★ In addition to the 920px+ layout, design and code what you think the fluid layout for 320px-919px should be.

- ★ Assume we are viewing this in the most recent version of Google Chrome.

- ★ The image is hosted here: https://images.harrods.com/content/brand-gucci-women_l.jpg?dwn=980px:0px

- ★ You should send us **one** harrods.html file that, when opened, just works - no build required. Use vanilla JavaScript and and put your CSS inline in the document <head>

- ★ Send us a paragraph explaining how you would have coded this if there were no constraints as to how you should submit the work. What's your ideal workflow?

- ★ Thank you, and good luck!
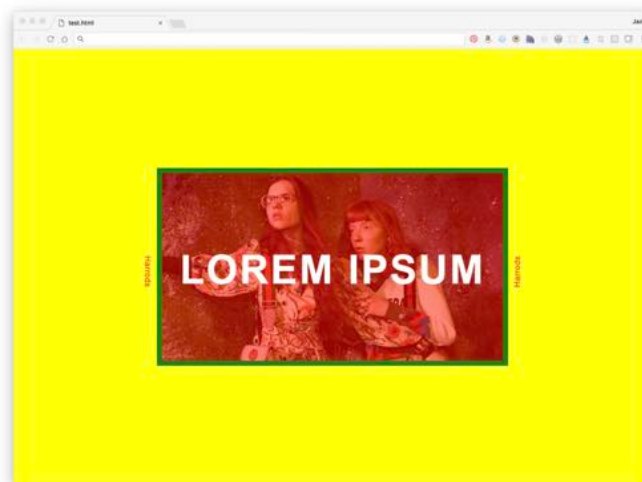

harrods-1.jpg
Default state of the page

harrods-2.jpg
When the user **hovers** over the image they should see the following:

harrods-3.jpg
When the user **clicks** on the image, the text should animate to show the following:

If the user clicks on the image again, revert to the state back to harrods-1.jpg
